

Install Azure CLI, kubectl, explore Azure Cloud Shell and see our Kubernetes resources from Azure Portal

- We'll need the following to interact with our AKS cluster via CLI:
 - Azure CLI: command-line tool for interacting with Azure services
 - kubectl: command-line tool for interacting with Kubernetes clusters
- Alternatively, we can use Azure Cloud Shell, which includes both Azure CLI and kubectl by default
- Azure Cloud Shell is a browser-based command-line interface tool from Microsoft used to create, manage, or administer Azure resources. It has two shell options: Bash and PowerShell. It can be opened directly from the Azure Portal

- If you are using Azure Cloud Shell for the first time, it will require a file storage area, like an Azure Storage Account
- We'll explore the Kubernetes resource from Azure Portal
