

Resize a node pool

- Resizing the VMSS is not supported, and directly changing the size of a node pool is not possible; thus, to workaroud this, we can:
 - Create a new node pool (np2) with the desired size
 - You always need to have one System node pool in the cluster
 - Cordon the nodes part of the existing node pool (np1)
 - Drain the nodes part of the existing node pool (np1)
 - Remove the existing node pool (np1)
- If you need to keep the name of the initial node pool in addition to the above, after you remove the existing node pool (np1) you will need to:
 - Create another node pool (np1)
 - Cordon the nodes part of the other node pool (np2)
 - Drain the nodes part of the other node pool (np2)
 - Remove the other node pool (np2)
- A node pool snapshot can be used to create the new node pool if the new size we want is from the same VM size
