

Connect to AKS nodes – via SSH using Azure Bastion

- **Azure Bastion**

- Fully managed Platform-as-a-Service (PaaS) resource that can be provisioned in a virtual network
- It offers immediate TLS-encrypted RDP/SSH connectivity to your virtual machines from the Azure Portal
- The VMs/nodes don't require an agent, particular client software, or a public IP address when you connect using Azure Bastion

- **Steps to connect to AKS Linux nodes via SSH using Azure Bastion**

- If you don't have an SSH key-pair, create one
- Update the AKS cluster with the SSH public key (if they don't have any)
- Create a subnet called AzureBastionSubnet in AKS's VNET or any VNET that has connectivity to AKS's VNET
- Create an Azure Bastion in AzureBastionSubnet
- From VMSS, Instances, select the instance, connect using the Azure Bastion with username “azureuser” and the private key
