

Exploring the AKS cluster – Kubernetes side

- **containerd**

- Installed as a Linux Service in AKS
- Containerd is AKS's default container runtime, replacing Docker which was used in the past
- A container runtime is installed on every node to run and manage container images
- It is OCI (Open Container Initiative) compliant, donated to the CNCF (Cloud Native Compute Foundation)
- Inside nodes, kubelet communicates directly with containerd via CRI (container runtime interface) plugin, comparing with Docker CRI implementation resulting in:
 - Implementation of the removal of extra hops
 - Lower startup latency for pods
 - Fewer CPU and memory usage
- crictl CLI is recommended to troubleshoot inside nodes
- cri logging format is used
