

Exploring the AKS cluster – Kubernetes side

- **coredns**

- Authoritative DNS server and Cloud Native Computing Foundation (CNCF) graduated project. It uses plugins, which are modular components that provide additional functionalities to CoreDNS
- Installed during deployment and used to resolve domain names of cluster services and pods
- For requests inside the cluster, CoreDNS uses kubernetes plugin
- For requests outside the cluster, CoreDNS uses the forward plugin, which forwards the request to `/etc/resolv.conf` on each node

Exploring the AKS cluster – Kubernetes side

- Default behavior is configured via the “coredns” ConfigMap
- Customizable via “coredns-custom” ConfigMap

```
$k get cm coredns coredns-custom -n kube-system
```

NAME	DATA	AGE
coredns	1	50d
coredns-custom	0	50d
