

Exploring the AKS cluster – Azure infrastructure side

- By default, the infrastructure resources get created inside the infrastructure resource group
- About the infrastructure resource group:
 - To be used only during the lifecycle of the AKS's cluster
 - The Azure resources inside the infrastructure resource group should be customized via an AKS node pool
 - Gets delete when AKS is deleted, together with the associated Azure resources
- Some Azure resources can be created before creating the AKS cluster, so they exist even after AKS cluster deletion
- We can see how all these resources are linked with the help of “Resource visualizer”
