

Connect to AKS nodes - via SSH using a pod

Steps to connect to AKS nodes via SSH using another pod

After you have an SSH key value for your AKS nodes, you can use a pod to connect to AKS nodes via SSH by following the next steps:

- Create a pod with the SSH utilities installed
- Copy the private SSH key to the pod: *kubectl cp /<path-to-SSH-key>/<SSH-key-name> <pod-name>:<path-where-SSH-key-will-be-copied>/<SSH-key-name>*

For example, where we assume “.ssh” is in the home directory (~):
kubectl cp ~/.ssh/id_rsa ssh-pod:/id_rsa

- Exec into the pod: *kubectl exec -it <podname> -- bash*
- While you are inside the pod, SSH to an AKS node: *ssh -i <path-to-SSH-key>/<SSH-key-name> azureuser@<node-name-or-IP>*

For example: *ssh -i /id_rsa azureuser@aks-nodepool1-31511967-vmss000008*

You should be connected to the AKS node now.
