

What are Docker, Dockerfile and Docker Hub?

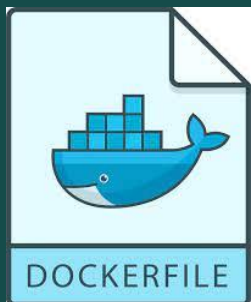

- Software framework / tool designed to create, deploy and run containerized applications
- Provides features to manage and orchestrate containers
- Is also a daemon representing the background process that runs the containers
- Container runtime: manages details of container creation and runtime

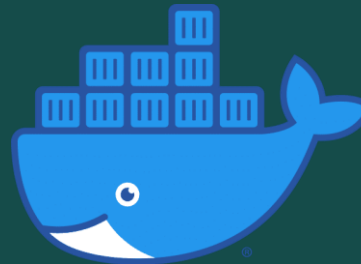

- Image: snapshot of a container
- Dockerfile:
 - Script that contains instructions for building an image
 - Usually starts with a base image, then run commands to install software, add files and configure the image

- Registry for storing and sharing images
- By default public, but you can use it as private

build

Docker Image

run

Docker Container
